

# LASER THERAPY WITH TRAINED VETERINARY TECHNICIANS

*Laser therapy stimulates cells and deep muscle tissues with light-wave technology.*

In this process, a laser emits photons of light over a specific area of pain; the energy delivered by the light changes cellular chemistry in a positive way - the photochemical reaction increases blood flow to tissues which stimulates the growth, replication, and repair of cells.

## *What can I expect during laser therapy treatments?*

After your veterinarian prescribes a treatment plan, laser treatments will be scheduled and performed by one of our licensed veterinary technicians.

The laser light is applied directly to the surface of the skin through a non-invasive hand piece. No sedation or hair clipping is required and most pets find the treatments relaxing and soothing.

Because laser therapy treatments are cumulative in nature, each additional treatment helps improve your pet's specific condition. The length and frequency of treatments varies with each pet's condition and will be determined by your veterinarian.

## THE BENEFITS OF LASER THERAPY

Increases circulation

Reduces inflammation & joint swelling

Releases tension to relax muscles and reduce stress

Promotes the healing process by increasing the flow of nutrients to muscles

Enhances muscle tone and range of motion

Increases the release of endorphins, the body's natural painkillers
